

ABSTRACT

The present invention refers to a process of communication utilizing at least one mobile device comprising means of mobile telecommunications (of GSM, GPRS, UMTS, CDMA, W-CDMA, etc type) and means of access to a local wireless network consisting of:

- recording user profiles, each bearing a numeric identifier in at least one database of numeric data;
- sending a first request, said request comprising a plurality of parameters and conveyed by the wireless local network;
- sending a second request to a server, this request comprising at least one list of identifiers made up of at least one identifier and conveyed via the mobile telephone network;
- processing the second request at the server level by means of the database comprising the user profiles and
- getting a response to the second request from the server and displaying this response on a screen of said device.

The present invention is also related to a system of communication for utilizing the process comprising a plurality of dual-compatible mobile devices, at least one database, at least one server, and at least one mobile telecommunications network.
